# Summary

---

- **Six IPM Model Runs:** 2 Reference Cases, 3 Mass-Based (E+N), 1 Rate-Based
- Rate and Mass produced very similar outcomes in terms of emissions and generation fuel mix in Iowa and the MISO region.
- Allowance/ERC prices were modest across the four policy cases due in part to the added renewable capacity additions in response to the PTC/ITC extension.
- Across the cases, CO<sub>2</sub> emissions in Iowa are reduced by approximately 10% from 2015 levels by 2030.
- Iowa is projected to remain a net exporter of electricity as wind capacity increases to about 8 GW; further capacity additions would allow Iowa to further expand its export margin.
- Relative to the reference case, retail bills are projected to be lower across the policy cases due to a combination of lower fuel costs, lower average consumption due to energy efficiency investments, and higher exports. Allowance value could be used to further mitigate potential rate impacts under a mass-based program.

# Major Changes from Prior Model Runs

---

- **Natural Gas Prices:** Gas prices are lower than prior round of analysis. The gas supply curve that we used is derived from the average of the AEO 2015 Reference Case and the AEO 2015 High Gas Resource Case (Henry Hub Gas Price). Basis differentials were derived from ICF's Integrated Gas Module.
- **ITC/PTC Extension:** On December 18, 2015, Congress passed extensions to the investment tax credit (ITC) and production tax credit (PTC) for renewable energy projects. With the addition of these extensions, total U.S. Wind capacity in the Reference Case increases by about 50 GW from 2015 to a total of 127.5 GW in 2020, vs. the prior Reference Case of 103.6 GW by 2020. Utility-scale solar capacity more than doubles from 2015 levels to a total of 35.9 GW in the updated runs vs. 26.9 GW in the prior Reference Case.
- **Energy Efficiency Assumptions:** We continue to model a range of energy efficiency levels (current, modest, and significant), but we modified our approach to “modest” case for some states. In the revised “modest” approach, states that are already achieving annual savings levels greater than 1% (of prior-year sales) maintain their historic (2013) savings levels.

# Scenarios Evaluated: Integrated Planning Model (IPM®)

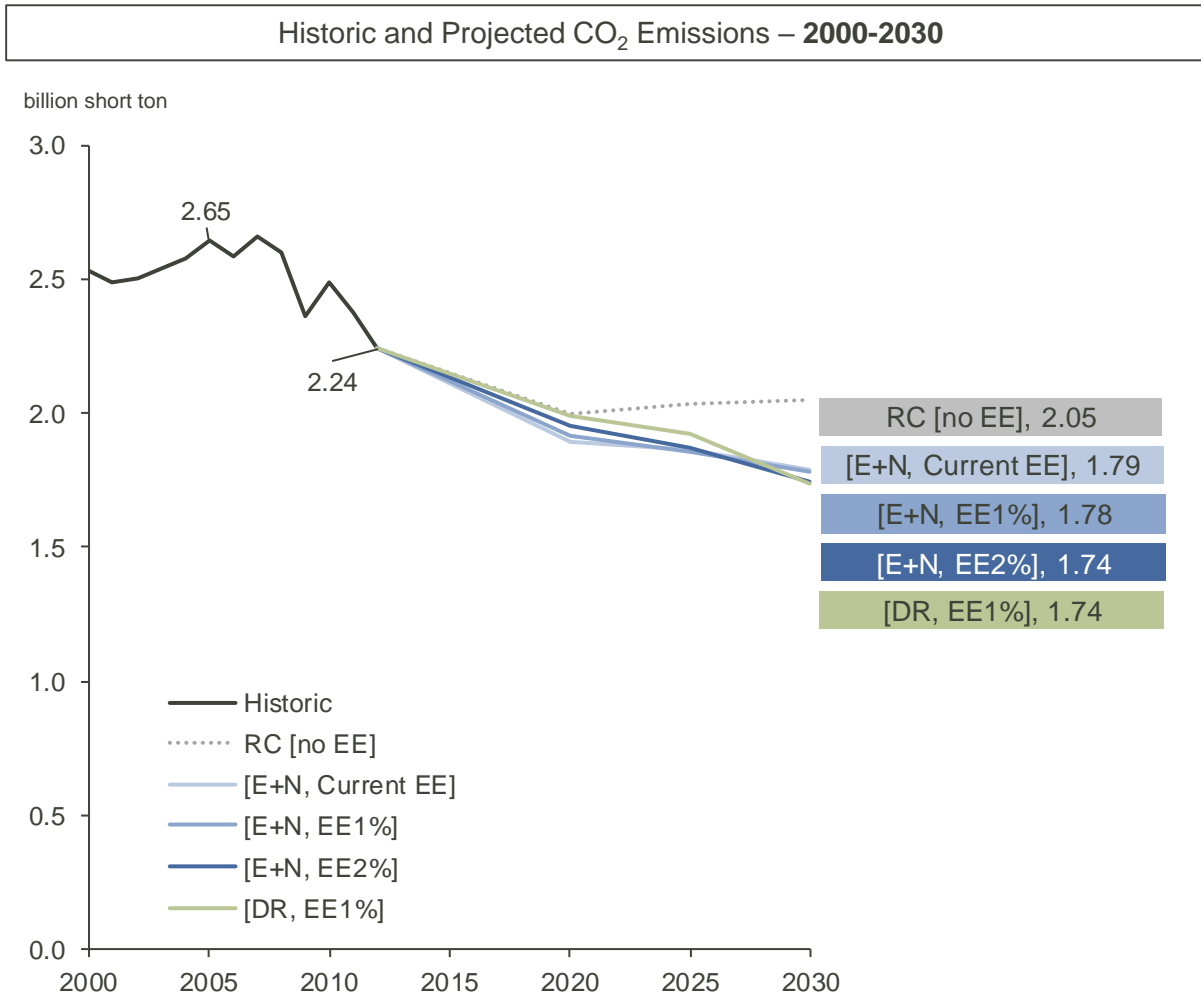

## Mass-Based Scenarios

| Code            | Regulatory Approach         | Level of Energy Efficiency | Trading Zones                                                                |
|-----------------|-----------------------------|----------------------------|------------------------------------------------------------------------------|
| E+N, Current EE | Mass-Based (Existing + New) | Current EE                 | <b>Nationwide trading</b> (except California; RGGI trades with other states) |
| E+N, EE1%       | Mass-Based (Existing + New) | Modest EE (1%)             | <b>Nationwide trading</b> (except California; RGGI trades with other states) |
| E+N, EE2%       | Mass-Based (Existing + New) | Significant EE (2%)        | <b>Nationwide trading</b> (except California; RGGI trades with other states) |

## Subcategory-Specific Dual Rate Scenario

| Code     | Regulatory Approach    | Level of Energy Efficiency | Trading Zones                                                                   |
|----------|------------------------|----------------------------|---------------------------------------------------------------------------------|
| DR, EE1% | Rate-Based (Dual Rate) | Modest EE (1%)             | Nationwide trading of RE, EE, Nuclear, and GS-ERCs (except California and RGGI) |

# Total U.S. Electric Sector CO<sub>2</sub> Emissions

# CO<sub>2</sub> Price (2012\$/ton)

---

## Allowance Prices

| Description     | 2025   | 2030   |
|-----------------|--------|--------|
| E+N, Current EE | \$0.00 | \$5.29 |
| E+N, EE1%       | \$0.00 | \$2.32 |
| E+N, EE2%       | \$0.00 | \$0.00 |

## ERC Prices

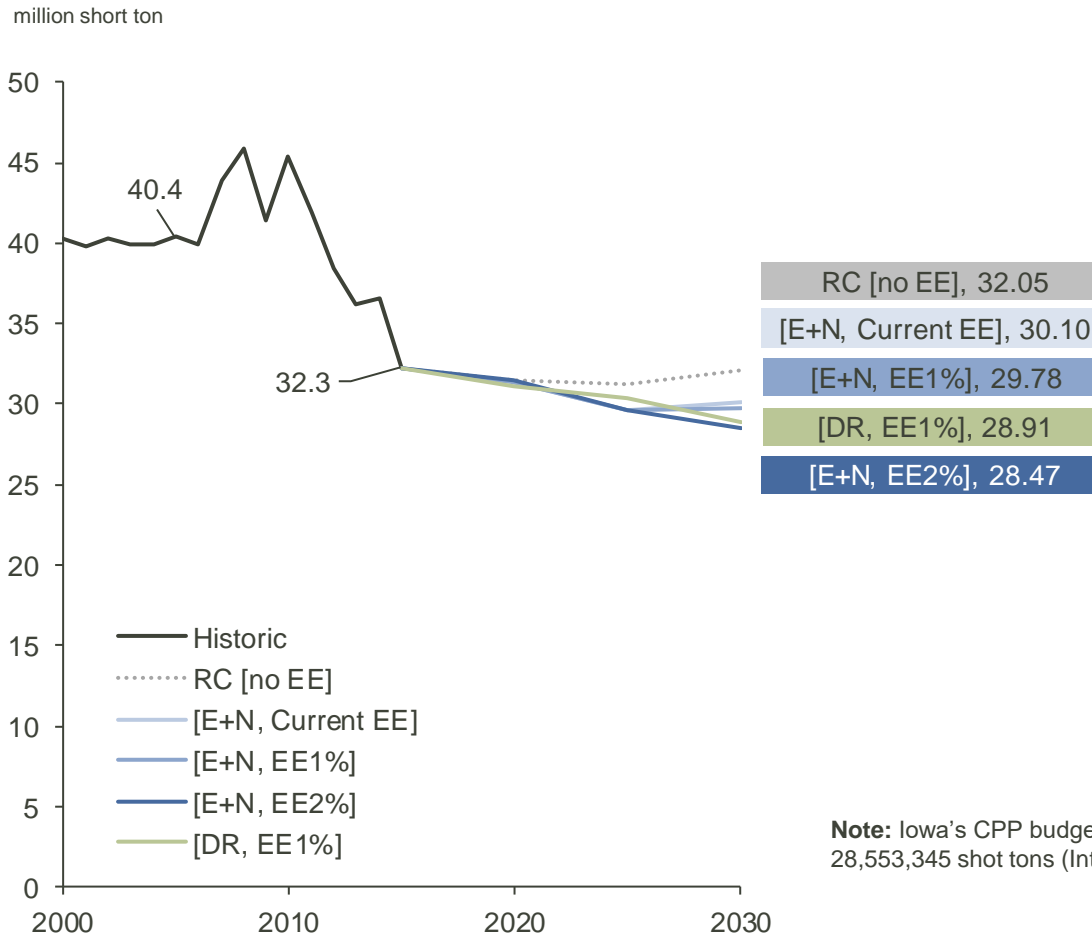

| Description | 2025   | 2030    |
|-------------|--------|---------|
| DR, EE1%    | \$0.00 | \$11.37 |

---

# Iowa and North Central Region Results

# Iowa Electric Sector CO<sub>2</sub> Emissions

Historic and Projected CO<sub>2</sub> Emissions – 2000-2030

**Note:** Iowa's CPP budgets for New and Existing Sources are 28,553,345 short tons (Interim) and 25,281,881 short tons (Final)

## Electricity Generation by Fuel Type: 2030

**Note:** According to EIA, 2014 Retail Sales in Iowa were equal to 47,201,853 MWh

# Net Exports (TWh)

2025

2030

## Capacity Factor by Fuel Type: 2030

---

| Scenario        | Coal | NGCC |
|-----------------|------|------|
| RC [no EE]      | 79%  | 48%  |
| E+N, Current EE | 77%  | 49%  |
| E+N, EE1%       | 77%  | 43%  |
| E+N, EE2%       | 76%  | 28%  |
| DR, EE1%        | 67%  | 67%  |

# Iowa Coal Capacity: 2030

**Note:** See appendix for further detail on Iowa firm builds and retirements.

# North Central Region Electricity Generation by Fuel Type: 2030

Generation by Type (TWh)

Note: Results for EPA MISO (North Central)

# Iowa Wind and Solar Capacity

Renewable Capacity by Type (GW)

**Notes:** Solar capacity is utility-scale only. Historic data is from EIA 860 and Electric Power Monthly (for 2015 data through December).

# Iowa Retail Bill Impacts (2012\$/Month)

2025

2030

# Hypothetical Compliance Tool Scenario

## Assumptions:

- 10 GW of wind by 2020
- Average capacity factor for wind of 36%
- State meets EERS
- 800 MW of NGCC; added coal retirements – to align with IPM numbers

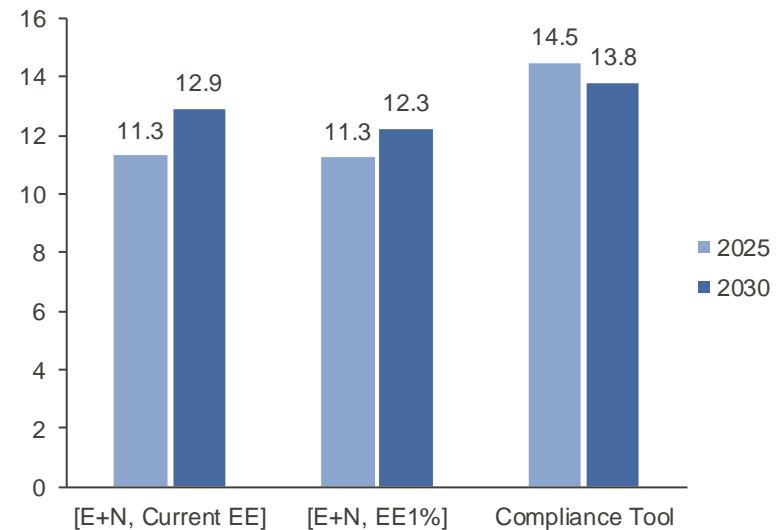

Net Allowance Position

|                        | 2025       | 2030       |
|------------------------|------------|------------|
| Net Allowance Position | 3,561,300  | 5,515      |
| Cumulative Allowances  | 17,686,652 | 25,683,465 |

Generation by Fuel Type (TWh)

Exports (TWh)

# Run Year Structure

---

| Model Year: | Representative of Average for Years: |
|-------------|--------------------------------------|
| 2020        | 2019-2022                            |
| 2025        | 2023-2027                            |
| 2030        | 2028-2033                            |

**Note:** throughout this summary report, when we refer to results in 2020, 2025, and 2030, we are referring to the model years above.

# Total U.S. Reference Case Highlights

## Reference Case Highlights

- Assumes existing power sector regulations (MATS, CSAPR, 316(b), AB 32, RGGI, state RPS)
- No Clean Power Plan
- AEO 2015 demand growth
- Henry Hub Gas price = \$4.15 to \$4.69 (\$/MMBtu)
- PTC and ITC extension
- 96 GW of coal retirements by 2030 (after 2016)
- 11 GW of nuclear retirements by 2030 (after 2016)

## Reference Case Generation – 2012-2030

### Announced Retirements

| Facility          | Fuel Type          | Number of Retiring Units | Summer Capacity (MW) | Year of Retirement |
|-------------------|--------------------|--------------------------|----------------------|--------------------|
| Milton L. Kapp    | Coal               | 1                        | 212.4                | 2015               |
| Walter Scott Jr.  | Coal               | 2                        | 133                  | 2015               |
| George Neal North | Coal               | 2                        | 423.6                | 2016               |
| Southerland       | Coal               | 2                        | 110.5                | 2016               |
| Dubuque           | Oil/Gas            | 2                        | 65.4                 | 2016               |
| Dubuque           | Combustion Turbine | 1                        | 2.3                  | 2016               |
| Lansing           | Combustion Turbine | 2                        | 2                    | 2014               |
| Milford           | Combustion Turbine | 2                        | 1.1                  | 2018               |
| Duane Arnold      | Nuclear            | 1                        | 578.3                | 2035               |

# Demand-Side Energy Efficiency Assumptions

---

- Historic rates of energy efficiency savings differ for each state and were drawn from the data reported by utilities in Energy Information Administration (EIA) Form 861, 2013, available at <http://www.eia.gov/electricity/data/eia861/>.
- In the “Current EE” scenario, the available supply of EE is calculated based on an extension of each state’s 2013 annual savings rate. The annual savings rate is held constant between 2018 and 2030 to derive incremental annual savings and cumulative savings estimates for each state.
- In the “Modest EE” scenario, the available supply of EE is calculated based on the methodology in EPA’s Regulatory Impact Analysis (RIA) for the Clean Power Plan. Cumulative efficiency savings are projected for each state for each year by ramping up from historic savings levels to a target annual incremental demand reduction rate of 1.0 percent of electricity demand over a period of years starting in 2020, and maintaining that rate throughout the modeling horizon.
  - Consistent with EPA’s approach, the pace of improvement from the state’s historical incremental demand reduction rate is set at 0.2 percentage points per year, beginning in 2020, until the target rate of 1.0 percent is achieved.
  - States already at or above the 1.0 percent target rate are assumed to remain at their historic savings rate beginning in 2020 and sustain that rate thereafter.
- In the “Significant EE” scenario, the available supply of EE is calculated based on the same methodology as the “Modest EE” scenario, but each state ramps up to a target annual incremental demand reduction rate of 2.0 percent of electricity demand.
- In the “Modest EE” and “Significant EE” scenarios, adoption of efficiency was modeled endogenously using a supply curve of program costs. In this simplified supply curve approach, the highest amount of savings assumed to be available to states in the supply curve varies by scenario, as described in the methodology above. The costs are based on LBNL’s comprehensive 2015 cost study, available at: <https://emp.lbl.gov/sites/all/files/total-cost-of-saved-energy.pdf>.
- Participant costs are accounted for in the calculation of total system costs.

# Retail Bill Calculation

---

The projected monthly average electricity bills (residential) reflect the combined effects of changes to average retail rates and average household electricity demand under the various modeling scenarios, and by region. Monthly bill impacts would change if the allowance value under a mass-based trading system was returned to customers.

The Retail Price Model accounts for variations in regulated and deregulated markets by calculating cost-of-service and competitive retail prices for each region and then weighing and allocating both to individual IPM regions according to the market structure that best represents each region:

$$\text{Regional Average Price (mills/kWh)} = \text{Competitive Retail Power Price} * \text{Deregulation Share (\%)} + \text{Cost-Of-Service Retail Power Price} * \text{Cost-Of-Service Share (\%)}$$

Competitive retail power price is comprised of competitive generation cost and transmission and distribution charges. Cost-Of-Service retail power price (cost divided by net sales) includes the cost of generation and the recovery of costs associated with transmission and distribution facilities and services.

Average retail bills are calculated based on retail rates and household demand, after energy efficiency savings.

# Renewables Capital Assumptions

---

- Renewables cost assumptions are presented on the following slide.
- These model runs assume that renewable resources are limited to 20 percent of net energy for load by technology type and 30 percent of net energy for load in total at each of IPM's U.S. sub-regions, on the assumption that grid integration impacts are relatively minor below these levels.
- Short-term capital cost adders are also assumed for wind and solar consistent with EPA's Base Case v.5.15. Capital costs increase when capacity additions exceed specified thresholds.
- Also, 2018 solar builds are limited to a 7.5 GW per calendar year and 2018 wind builds are limited to a 15 GW per calendar year.

# Renewable Cost Assumptions

| RE Potential Build Cost and Performance - EPA v5.15 |            |           |                                                  |                                  |                  |                |

**Note:** Capital cost multipliers are used to adjust region specific capital cost assumptions. For example, the Capital Cost Regional Multiplier for Onshore Wind in Iowa (MIS\_IA) is 1.03.

\*EPA's analysis includes three different landfill gas build options with varying capital costs (LGLo, LGvLO, LGHi). The costs shown above are for the mid range LGLo.
