

## Iowa Monitoring Locations and Design Values for Sulfur Dioxide 2014-2016

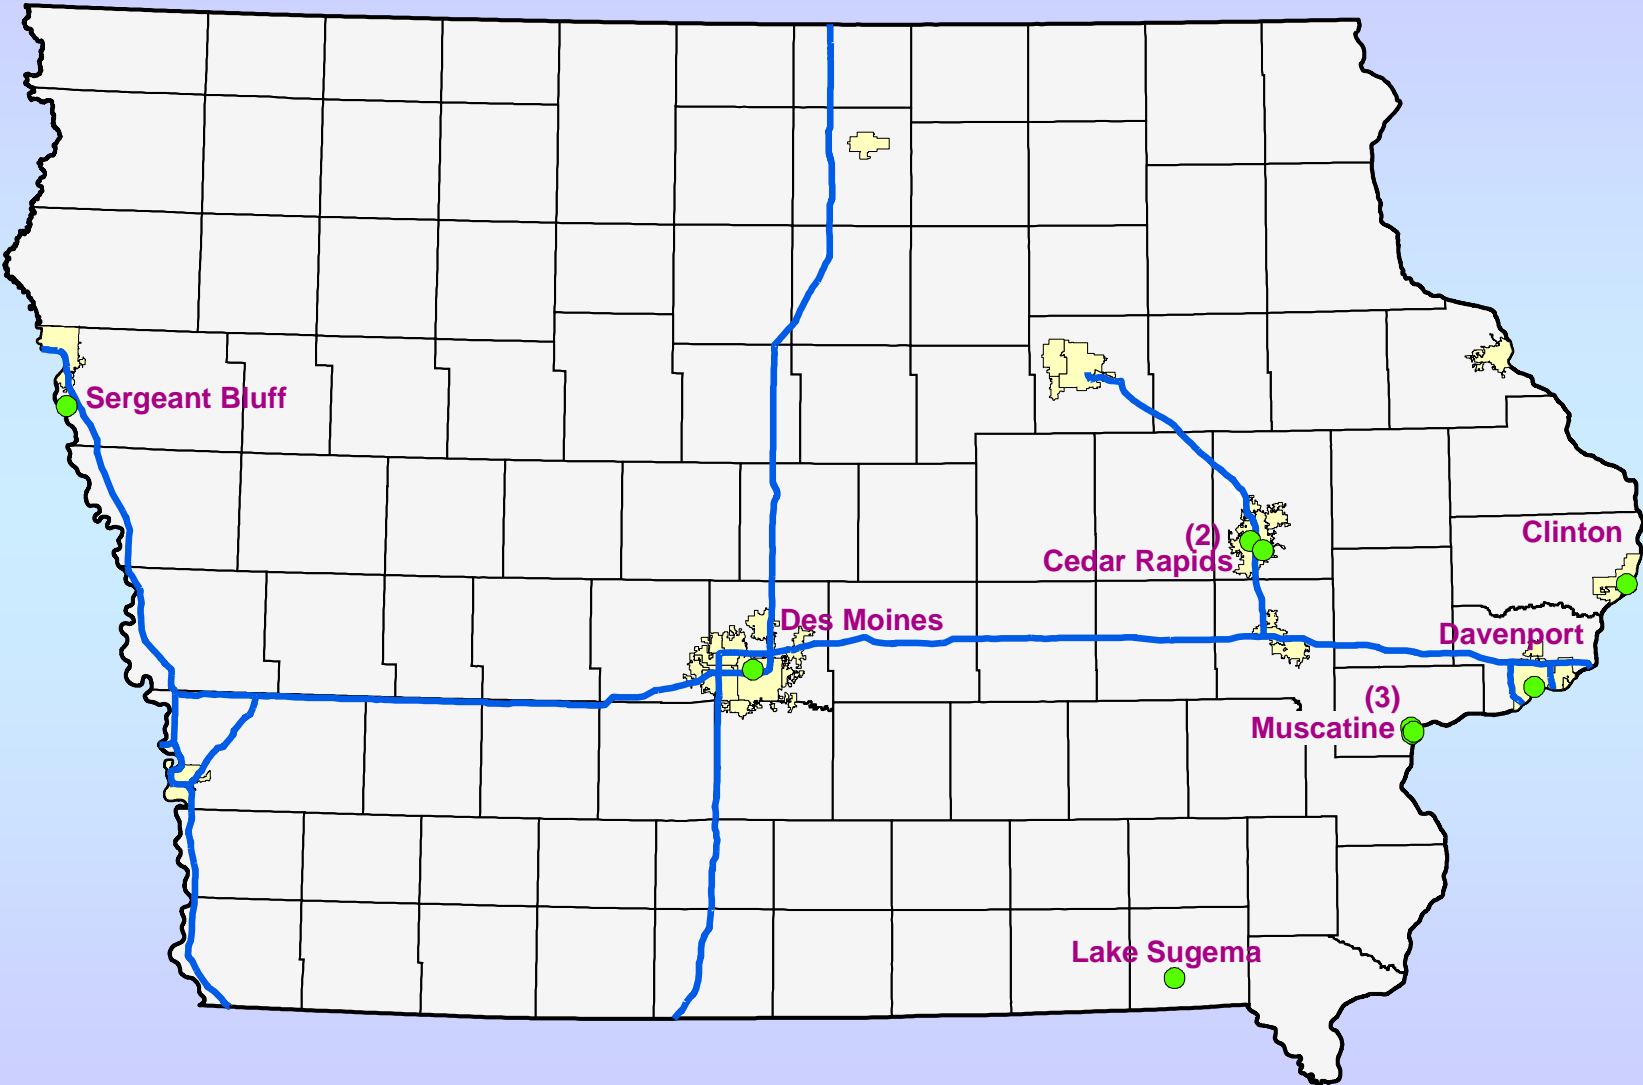

A design value is a tool that can be used to understand pollution levels at a specific location. A design value may be set for any pollutant. The U.S. EPA's official definition is explained this way: "a design value is the mathematically determined pollutant concentration at a particular site that must be reduced to, or maintained at or below the National Ambient Air Quality Standard to assume attainment." The design value number tells us how a particular site or area compares with the National Ambient Air Quality Standards (NAAQS).

Iowa sulfur dioxide (SO<sub>2</sub>) monitor location and information is detailed on the following pages. The EPA design value for 1-hour SO<sub>2</sub> is equal to the average of the annual 99th percentile daily maximum 1-hour value for the most recent three years. The EPA revised the SO<sub>2</sub> NAAQS in June of 2010. A monitoring site must have a design value less than 76 parts per billion to be considered "in attainment" with the SO<sub>2</sub> NAAQS. Additional information on the revised SO<sub>2</sub> standard is available here: <https://www.epa.gov/so2-pollution>
