LASER INDUCED FLUORESCENCE (LIF) REPORTS

When submitting the results of an investigation using LIF to the DNR please include the following:

- LIF Report from the vendor that conducted the LIF investigation including all individual borehole logs showing fluorescence response and calibration information.
- Pertinent 3D plume images and plume maps printed (in color) from the vendor supplied software. Include lithology if possible.
- Narrative describing the approach selected to remediate the identified free product.

The LIF documentation provided will aid in justifying the selection.

This will allow all involved parties to review the same images and provide a hard copy for the DNR LUST file. A copy of the software file containing the LIF data should be provided to the DNR upon request.
